## 2. 1994 Q4

(a) (i) Pentanoic acid
(ii) $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}$
(iii) $163 \pm 2$
(iv) The boiling point increases with increase in $\mathrm{CH}_{2}$ i.e with increase of carbon. This is because the molecular mass increases in $\mathrm{CH}_{2}$, it follows that this increase in intermolecular force, will require more heat to break the bond.
(b) Effervescence, colourless gas is given off/ $\mathrm{CO}_{2}$ is given off(turns lime water turbid)
(c) Let the volume be $\mathrm{Vcm}^{3}$

Moles of $\mathrm{NaOH}=\mathrm{V} \times \frac{0.2}{100}$
Moles of $\mathrm{C}_{3} \mathrm{COOH}=\frac{3,0}{60}=0.05$
Since 1 mole of $\mathrm{NaOH}=1$ mole of $\mathrm{C}_{3} \mathrm{COOH}$
$\mathrm{V} \times \frac{0.2}{100}=0.05$
$\mathrm{V}=\frac{0.05}{0.2} \times 1000=250 \mathrm{~cm}^{3}$
