2. Weight on side A has bigger volume when water is added.
3. Centre of gravity of A is at (geometric) centre while that of B is lower when rolled. Centre of gravity of A stays in one position while that of $B$ tends to be raised resisting motion as it resists; thus slowing down B . OR B there is friction force between the surfaces which resists motion.
4. No air on moon surface / no air pressure / no atmosphere.
5. When the permanganate dissolves / or breaks up into particles (molecules) these diffuse through the water molecules
6. When rises up the tube into the flask or water is sucked into the tube or bubbles are seen momentally.
7. Cold water causes air in the flask to contract // reduces pressure inside flask or when cold water is poured it causes a decrease in volume of air the flask or pressure increases in the flask // volume of the flask decreases.
8.

9. Point action takes place at sharp points (A, B , C, D ), charge concentrates at sharp points causing high pd, this causes air the surrounding to be ionized. The positive ions are repelled causing points to move in opposite direction.
10. By forming hydrogen layer / cover or hydrogen atoms or molecules which insulate the copper plate OR forming it cells between hydrogen and zinc which opposes the zinc copper cell or by forming a hydrogen layer / cover which increases internal resistance.

Methylated spirit will boil faster / evaporates / more volatile causing loss of heat through latent heat of vaporization.
20.

21.

22.

23.

24. Since masses are the same, there are more hydrogen molecules than oxygen molecules/more collision in B than in A and hence more pressure in B. Collision in B is higher than in A .
